Acmon Group commissioned another Project in the Chemical Industry Sector

Bearbeitet von am 29. Sep. 2021

Schimatari, Griechenland –

Chemical processing plants use specialized equipment and technologies that must withstand the most demanding requirements and harshest operating conditions.

The extreme conditions found in chemical processing plants place extraordinary demands on equipment to withstand heat, pressure, stress, and corrosion over operating periods of up to decades.

Acmon Group of Companies has been addressing these process engineering challenges for the past three decades, gaining extensive experience and knowledge in the chemical industry by supplying both individual process lines and

complete turnkey plants.

Construction chemistry, one of Acmon's most important chemical subsectors, presents its own special challenges for both wet and dry production plants. A typical example of a dry production plant successfully commissioned is the

project for Alchimica.

It is a complete processing plant that includes the reception of raw materials in big bags, 25 kg bags and, of course, silos, a grading process line, a conveying system, and production lines for bagging and palletizing polyurethane-based chemical materials for the construction industry.
