## Moisture in SRF

Edited by on 6. Dec. 2022

SRF preparation is usually carried out directly on waste sorting and recovery sites, for which it represents a complementary activity which in turn creates more jobs. The SRF preparation lines are deployed to treat the waste in a five-step process: crushing, drying, sorting, second crushing, pelletizing.

Typical accuracy is about  $\pm 0.2$  percent for ash moisture applications with a moisture range of 0 to 30 percent moisture. Once installed, operators can continuously monitor the process and control the moisture content either manually or automatically.
