HENNLICH - Corporate Profile Video

Edited by on 25. Oct. 2015

HENNLICH ENGINEERING is an engineering and manufacturing division that deals with bulk material transportation and storing. Its main product line is loading spouts for dust-free loading of bulk solids in places where loose mass is handled and dust tends to disperse into the air

Dust pollutes the environment, is unhygienic and has a negative effect on the safety of all operations. During loading of bulk solids huge losses of material can occur. Those and other problems can be solved by using the company's loading spouts. HENNLICH ENGINEERING also manufactures filter units that are used for dust suppression in plants and silo storage. Its line of fog cannons can be used for dust suppression on open piles of bulk solids or on haul roads.
