New Energy Chain Systems for the Bulk Handling Industry

Edited by on 21. Sep. 2022

In the area of bulk handling, equipment must function under tough and dirty conditions and work reliably even in bad weather. igus® offers plastic components for bulk handling technology that make exactly that possible and are characterised by their robustness and long service life. These include energy chains, cables and hoses, which are used for example in bucket-wheel excavators, ship loaders, portal scrapers, wagon tippers, conveyor belts, lifts, silos and funnels.

Project Engineering Team will assist you with the sizing, design, the construction, the project management, the reconstruction, the installation and the commissioning on site. You can find references to mining, raw materials such as ore, coal, fertiliser, road salt and food bulk materials on our homepage.
