WAMGROUP: Polymer Granules on the Banks of the Dnieper

Edited by on 6. Jul. 2017

Ponte Motta-Cavezzo (MO), Italy -

WAMGROUP®'s Russian subsidiary, WAM Moscow, was able to provide the equipment the customer needed to process from now the raw materials necessary for the production of their own polymer granules: screw feeders and conveyors both in carbon and stainless steel, bin activators, butterfly and ball segment valves, silo monitoring instruments and flow aids. All the powdery ingredients go into an extruder, which provides the granules, part of which is intended for their own production. The rest is sold to the market.

Thanks to the investment, the company has been able to enter the public sector and industries all over the Russian Federation.
